

Waze Churn Project

Preliminary Data Analysis

OVERVIEW

Waze data team was given the task of inspecting the dataset for the data of waze users churn rate. Our goal is to develop a machine learning model for predicting user churn.

PROJECT STATUS

- The project is in its early stages and currently in the Plan & Analyze stages.
- The dataset is now cleaned and ready for the next stage of exploratory data analysis.
- We believe the dataset is reliable and can be used to achieve project goals.

NEXT STEPS

- Our next step is to discover relationships between variables by performing exploratory data analysis with descriptive statistics and eliminating outliers.
- We recommend collecting more data about this type of users to analyze their experience.

KEY INSIGHTS

- The data have 11 columns of types integers and float and 2 are strings.
- The dataset contains 14999 observation with 13 characteristic for each observation.
- Four columns of the data contain outliers and there is 700 missing value that don't reveals whether user has churned or not.
- The data is representative of serious users whom drive for large distances and high number of drives per day.
- Three columns were added that reveals important insights that would be of benefit in future analysis
